

JavaScript Popup Boxes - Lesson

JavaScript provides different types of popup boxes that allow interaction with the user. Popup boxes are used to display messages, warnings, or to take input from the user. The three main types are: alert, confirm, and prompt.

Types of JavaScript Popup Boxes:

- **alert()**: Displays a simple message to the user with an OK button.
- **confirm()**: Displays a message with OK and Cancel buttons. Returns true if OK is clicked, false otherwise.
- **prompt()**: Displays a dialog box asking the user to input text. Returns the input or null if cancelled.

Examples of Popup Boxes in JavaScript:

alert() Example:

```
alert("Welcome to JavaScript!");
```

confirm() Example:

```
let result = confirm("Are you sure you want to continue?");
if (result) {
  console.log("User clicked OK");
} else {
  console.log("User clicked Cancel");
}
```

prompt() Example:

```
let name = prompt("What is your name?");
console.log("Hello " + name);
```
