

HTML Phrase Tags and Tables Lesson

HTML provides a variety of **phrase tags** to give semantic meaning to text and **table elements** to organize data in rows and columns. This lesson covers commonly used phrase tags and basic table structure.

1. HTML Phrase Tags

Phrase tags are used to define the meaning or style of a particular portion of text. These tags help search engines and assistive technologies understand the content better.

Tag	Description	Example
<code></code>	Emphasized text (italic by default)	<code>Important</code>
<code></code>	Strong importance (bold by default)	<code>Warning</code>
<code><mark></code>	Highlighted text	<code><mark>Highlight</mark></code>
<code><abbr></code>	Abbreviation or acronym	<code><abbr title='World Health Organization'>WHO</abbr></code>
<code><cite></code>	Title of a work	<code><cite>The Great Gatsby</cite></code>
<code><code></code>	Inline code snippet	<code><code>console.log('Hello')</code></code>
<code><kbd></code>	Keyboard input	<code><kbd>Ctrl</kbd> + <kbd>C</kbd></code>
<code><sup></code>	Superscript text	<code>X<sup>2</sup></code>
<code><sub></code>	Subscript text	<code>H<sub>2</sub>O</code>

2. HTML Tables

HTML tables allow you to display data in a structured grid format. The basic elements are: **<table>** – defines the table **<tr>** – defines a table row **<th>** – defines a table header cell **<td>** – defines a table data cell

Code Example:

Example: Name Age Alice 25 Bob 30

This will produce a simple table with a header row and two data rows.
